

# AcuPlas®

## BENEFITS

The main benefits of AcuPlas® are in the natural materials of which AcuPlas® is made of. Without any known contra-indications, AcuPlas® may be kept on the skin for several days, with the aid of a simple plaster.

AcuPlas® may be applied on its own or as a complementary resource to traditional methods, extending the desired effects of these methods for up to 2 weeks.

AcuPlas® is water resistant, Non-invasive application for pain and inflammation relief, affordable and easy to apply.

### Resonance & Health

The more than 70 trillion cells in the human body generate Vital Energy ("Qi") through the presence of an Ideal Electrical Frequency within the tissues. This frequency is known as Biological Resonance or bioresonance. This bioresonance coordinates as well as powers the physiological and psychological activities in our daily living.

Conditions such as inflammation, caused by injuries or the body's defence mechanism in combating pathogens and diseases, alter the bioresonance in the tissues, becoming an inhibitor to the electrical current and the interruption of Qi flow.

The disrupted bioresonance places negative influence on physiological activities leading to Pain and detrimental to Health.

### Enhancing the BioResonance

As a part of our daily activities, we are constantly enhancing these bioresonance through our intake of quality nutrients, air and exercise. While the oldest form of biological resonance can be found in Sunlight, as it touches our skin, triggering off regulatory processes including e.g. pigmentation or the formation of vitamin D, the urbanised environment in which we live in today prevents a regular dosage of this natural resonance.

Alternative means of enhancing the bioresonance includes active mechanical approaches in physical exercises as well as passive methods offered by both Modern and Traditional systems.

Modern methods for the regulation and enhancement of our bioresonance employ technology found in Pulsating Electromagnetic Resonance as well as other various forms of vibration machines and ingestion of negatively charged water and products.

Traditional methods including Moxibustion, Gua Sha, Acupuncture, Shiatsu Massage, Ventosa Cupping etc., provides stimulation to the affected tissues with the aim of removing the blockages and relief of inflammation and pain.

### Comparative Studies

This representation show the application of acupuncture combined with AcuPlas® will allow us to obtain a continued improvement on the therapy that will be more stable and with uniform results.

## Tonify or Sedate

The methods employed regulates the bioresonance through tonifying or sedating of the acupuncture points. These points are located within the meridians regulating the Qi in the tissues or organs. Hyper resonance is sedated while Hypo resonance is tonified. This is done with methods as simple as heating or cooling the affected sites, bringing the affected resonance to the desired frequency.

## Maintaining the BioResonance

By far the toughest obstacle in the management of health lies in the maintenance of the desired bioresonance. While the stimulation methods may assist in bringing the bioresonance frequency to the desired levels, it is difficult to maintain these achieved levels due to our modern day lifestyle.

Our pace of life and dietary schedules added to the high radiation environment, in which we live, constantly affects and influences the bioresonance frequencies resulting in distortion and disruptions.

AcuPlas® effectiveness up to a period of 2 weeks.

## Silica

Silica or a chemical compound silicon dioxide (SiO<sub>2</sub>) is the most abundant mineral within the Earth's crust. It is most commonly found in nature as sand and quartz. In nature, silica plays an important role in the management of the Earth's environment and its stability including the regulation of the Earth's environmental resonance, also known as the Schumann's Resonance at 7.83 hz. This resonance is common referred to as the Healing Frequency in the practices of natural healing.

## AcuPlas®

AcuPlas® is made of silica and vegetable fibre, to create a soft and easy to apply solution for the purpose of regulation of the bioresonance, brings the relief for pain and inflammation.

AcuPlas® is environmentally friendly as it is made of all natural material and is a Non-invasive application. By placing the AcuPlas® over the affected areas of the body, the bioresonance in the affected meridians can be regulated through tonification or sedation.

## Benefits of AcuPlas®

The main benefits of AcuPlas® are in the natural materials of which AcuPlas® is made of. Without any known contra-indications, AcuPlas® may be kept on the skin for several days, with the aid of a simple plaster. AcuPlas® may be applied on its own or as a complementary resource to traditional methods, extending the desired effects of these methods for up to 2 weeks. AcuPlas® is water resistant, Non-invasive application for pain and inflammation relief, affordable and easy to apply.

## How does AcuPlas® Work?

Traditional and Natural medicine have long established the basis that the body works as a unit and is capable of self recuperation, regeneration and rejuvenation. With the principles that the body is Electrochemical by nature and is able to produce its own healing chemicals, practices stimulating the production of such chemicals includes Moxibustion, Acupuncture, Shiatsu Massages etc..

However, such practices, which stimulates the reaction from the body through minor injuries via heat, pressure or punctures produce effects that would decline or expire in less than 24 hours.

## AcuPlas® works in 2 ways.

On its own, AcuPlas®, when applied on the pain spots or acupuncture points, is able to amplify or regulate the Original bioresonance from the body, through reflection and refraction. The effect is similar to burying one's body in the sand causing a stabilisation factor through the natural occurring silica found in the sand.

In this method, AcuPlas® simply makes use of the body's original bioresonance by returning it in a regulated form over a gradual period of time. Working as a **Complementary Resource** to traditional applications, AcuPlas® works to extend the effects generated in the stimulation by such applications. With the application of AcuPlas® on the affected spots or acupuncture points, after treatment, the effects may be sustained up to a period of 2 weeks.

The best reference for AcuPlas® would be the "short needle" acupuncture technique pioneered by Kobei Akabane in the 1950s. While the traditional long needles utilised in acupuncture could be kept on the body for only 30-40 minutes, the short subcutaneous needles by Akabane could be inserted and kept on the body, by plasters, for days extending the effects of the stimulation. However, this method generates both discomfort and potential problems usually resultant of an invasive practice.

With AcuPlas®, the extended benefits of Akabane's short needles can be attained without any of the disadvantages.
